

PROJECT DOCUMENTATION

Incident Lifecycle Automation in ServiceNow

Functional / System Documentation

Project Title	Incident Lifecycle Automation in ServiceNow
Project Type	Individual Project
Platform	ServiceNow
Project Area	IT Service Management (ITSM)
Date	19 September 2026

Reference Format

This document follows the uploaded FSD Documentation Format and adapts its sections to the ServiceNow project. The reference contains Introduction, Project Overview, Architecture, Setup Instructions, Folder Structure, Running the Application, API Documentation, Authentication, User Interface, Testing, Screenshots/Demo, Known Issues and Future Enhancements.

1. INTRODUCTION

Project Title

Incident Lifecycle Automation in ServiceNow

Team Members

Individual Project

Project Objective

To configure a structured ServiceNow IT incident workflow that automates priority calculation, supports consistent classification and assignment, controls incident lifecycle processing, and provides operational visibility through Platform Analytics.

2. PROJECT OVERVIEW

Purpose

The project provides a structured and automated approach to IT incident management, covering incident creation, classification, Impact/Urgency based priority calculation, assignment, work, resolution, closure and reopening.

Features

Feature	Description
Incident Management	Create and manage IT incident records.
Classification	Use configured Category and Subcategory values.
Priority Automation	Calculate Priority using Impact and Urgency through Client Script logic.
Assignment	Route incidents through Hardware, Software and Network assignment groups.
Lifecycle Controls	Support work, resolution, closure and reopening activities.
Knowledge / Change	Provide related-record context for incident handling.
Platform Analytics	Monitor incidents by priority, state, category and assignment group.

3. ARCHITECTURE

Layer	Implementation
User Layer	End users and service desk agents interact with ServiceNow incident forms.
Application Layer	ServiceNow Incident Management stores and manages incident records.
Automation Layer	Client Script logic calculates Priority from Impact and Urgency; lifecycle configuration controls processing.
Assignment Layer	Hardware, Software and Network groups provide incident ownership.
Related Services	Knowledge and Change Management information can be associated with incidents.
Analytics Layer	Platform Analytics provides visualizations and filters for incident monitoring.

Incident Lifecycle

Stage	Activity
Create	New incident record is created.
Classify	Category and Subcategory are selected.
Prioritize	Impact and Urgency determine Priority.
Assign	Incident is routed to an assignment group/user.
Work	Support activity and notes are recorded.
Resolve	Resolution information is entered.
Close	Incident is completed/closed according to configuration.
Reopen	Supported reopening returns the incident to active processing.

4. SETUP INSTRUCTIONS

Prerequisites

- Access to the configured ServiceNow instance.
- Appropriate ServiceNow roles/permissions for configuration and testing.
- Web browser for accessing the ServiceNow interface.

Configuration Steps

Step	Activity
1	Open the ServiceNow project/application environment.
2	Verify Incident Management configuration and required fields.
3	Verify Category and Subcategory choices.
4	Verify Hardware, Software and Network assignment groups.
5	Verify the Impact/Urgency based Client Script.
6	Verify lifecycle, resolution and closure behavior.
7	Verify Platform Analytics dashboards, visualizations and filters.
8	Execute functional and performance test scenarios.

Environment Variables

No application-specific environment-variable file is required for the demonstrated ServiceNow configuration. Instance URL and credentials are environment-specific and are not included.

5. FOLDER STRUCTURE

The MERN-oriented folder structure in the reference is not applicable to this ServiceNow project. The implementation is maintained inside the ServiceNow platform instance rather than as a conventional React/Node folder tree.

ServiceNow Area	Purpose
Application / Scope	Contains project application configuration.
Incident Configuration	Contains incident fields, choices and lifecycle behavior.
Client Scripts	Contains client-side JavaScript used by the project.
Assignment Groups	Contains support ownership groups.
Knowledge / Related Records	Provides supporting incident information.
Platform Analytics	Contains dashboards, visualizations and filters.

6. RUNNING THE APPLICATION

Because the project is implemented in ServiceNow, there are no npm start commands or separate frontend/backend servers. The application is run by accessing the configured ServiceNow instance through a web browser.

Action	Procedure
Access	Open the ServiceNow instance URL in a supported browser.
Open application	Navigate to the configured incident/application area.
Create incident	Create a new incident record.
Test automation	Select Impact and Urgency and verify Priority.
Process incident	Assign, work, resolve and close the incident.
Monitor	Open Platform Analytics and review dashboards/filters.

7. API DOCUMENTATION

The reference requests backend API endpoints. This ServiceNow implementation does not use a separately developed Node.js/Express REST API within the documented project scope. Therefore, no custom API endpoint list is included.

Specific ServiceNow API endpoints, authentication headers and request/response payloads were not supplied in the project evidence, so they are not invented in this documentation.

8. AUTHENTICATION

Authentication and authorization are handled by the ServiceNow platform and the roles/permissions configured for the instance. Usernames, passwords, tokens and other credentials are not included.

Area	Handling
User Access	Controlled through the ServiceNow instance.
Authorization	Based on ServiceNow roles and permissions.
Credentials	Not included for security reasons.
Application Logic	Users access configured incident functions according to permissions.

9. USER INTERFACE

The user interface is provided by the ServiceNow platform. The main project UI is the Incident record/workspace, where users enter incident information, classify the issue, view Impact/Urgency and Priority, assign the incident and manage its lifecycle.

UI Components

UI Area	Purpose
Incident Form	Create and update incident records.
Classification Fields	Category and Subcategory selection.
Priority Fields	Impact, Urgency and automatically calculated Priority.
Assignment	Assignment Group and assigned user.
Resolution	Resolution details and closure information.
Related Records	Knowledge and change information.
Analytics Dashboard	Visual monitoring of incident data.

Reference Note

The uploaded FSD template requests screenshots/GIFs for UI features. ■filecite■turn3file0■L31-L37■ Your ServiceNow demonstration screenshots can be inserted here as project evidence.

10. TESTING

Testing Strategy

Testing covers functional behavior and performance-oriented behavior. Functional testing verifies incident creation, classification, priority automation, assignment, lifecycle, resolution, closure and reopening. Performance testing checks response time, dashboard loading and controlled concurrent usage.

ID	Test	Expected Result
FT-01	Incident form validation	Configured fields and validation behave correctly.
FT-02	Priority automation	Priority updates from Impact/Urgency.
FT-03	Assignment	Incident ownership is correctly recorded.
FT-04	Lifecycle processing	Supported state transitions work.
FT-05	Resolution validation	Resolution information is correctly captured.
FT-06	Reopen processing	Completed incident can return to active processing.
PT-01	Form response time	Record actual incident-form loading time.
PT-02	Priority response	Priority updates promptly after field changes.
PT-03	Save response	Record save/update completes without abnormal delay.
PT-04	Dashboard load	Analytics dashboard loads successfully.
PT-05	Concurrent access	Multiple sessions work without abnormal failure.
PT-06	Dashboard concurrency	Dashboard remains usable across sessions.

11. SCREENSHOTS OR DEMO

The project demonstration is performed through the ServiceNow instance. It covers incident creation, classification, priority automation, assignment, work/resolution, closure or reopening, related records and Platform Analytics.

Demo Step	Demonstration
1	Create/open incident.
2	Set Category and Subcategory.
3	Set Impact and Urgency and show Priority.
4	Show Assignment Group and ownership.
5	Show work/activity and state.
6	Show resolution and closure.
7	Show reopening if required.
8	Show knowledge/change related information.
9	Show Platform Analytics dashboard and filters.

12. KNOWN ISSUES

No blocking issue was identified in the demonstrated core incident lifecycle. The implementation depends on correct ServiceNow configuration, roles, assignment groups, Client Script behavior and dashboard configuration.

Area	Observation
Performance	Actual response-time/load values require execution in the target ServiceNow instance.
Permissions	Available functions may differ according to user roles.
Configuration	Incorrect configuration can affect priority, lifecycle or reporting behavior.
Enterprise Integration	Production integrations and SLAs are outside the demonstrated scope.

13. FUTURE ENHANCEMENTS

- Integrate richer SLA monitoring and automated escalation.
- Add CMDB/configuration-item based incident intelligence.
- Introduce automated knowledge recommendations.
- Extend assignment automation using additional incident attributes.
- Add notification integrations for incident status changes.
- Expand Platform Analytics with trend and workload analysis.
- Integrate additional enterprise ITSM processes and external systems.
