

Acceptance Testing

UAT Execution & Report Submission

Date	19 September 2026
Team ID	Individual project
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to explain the UAT test coverage and open issues of the Incident Lifecycle Automation in ServiceNow project. Testing covers the complete Incident lifecycle: incident creation, classification, impact and urgency selection, automatic priority calculation, assignment group routing, state progression, resolution, closure, reopening, knowledge linkage, change linkage, and Platform Analytics monitoring.

2. Defect Analysis

During the UAT review of the implemented incident lifecycle workflow, no known defects were recorded for the core incident creation-to-resolution flow. Since no defects were recorded, all severity counts are zero.

3. Test Case Analysis

This section summarizes the UAT test cases for the main functional areas of the Incident Lifecycle Automation workflow, including incident creation, classification and priority automation, assignment, lifecycle state management, resolution and closure, reopening, related records, and analytics.

Section	Total Cases	Not Tested	Fail	Pass
Incident Creation	3	0	0	3
Classification & Priority Automation	3	0	0	3
Assignment & State Management	2	0	0	2
Resolution & Closure	2	0	0	2
Reopen / Related Records	3	0	0	3
Platform Analytics	3	0	0	3
Total	16	0	0	16

4. UAT Test Scenarios

ID	Test Scenario	Test Action	Expected Result
TC-01	Create Incident	User creates a new incident and enters caller and description.	Incident record is created successfully.
TC-02	Classify Incident	User selects Category and Subcategory.	Configured category and subcategory values are available and retained.
TC-03	Automatic Priority	User changes Impact and Urgency values.	Priority is automatically calculated according to the configured Client Script.
TC-04	Assign Incident	User selects an appropriate assignment group and assignee.	Incident is assigned to the selected support group/user.
TC-05	Start Work	Assigned agent moves the incident into the configured working state.	Incident progresses to the appropriate state and activity is recorded.
TC-06	State Management	User changes the incident through supported lifecycle states.	Only configured lifecycle transitions are applied.
TC-07	Resolve Incident	Agent enters resolution information and completes the incident.	Resolution details are stored and incident can be resolved.
TC-08	Close Incident	Resolved incident is moved to the configured closed state.	Incident is successfully closed with resolution information retained.
TC-09	Reopen Incident	User reopens a completed/closed incident.	Incident becomes active again and can continue through the lifecycle.
TC-10	Knowledge Linkage	User opens related records and associates/views relevant knowledge.	Relevant knowledge information is accessible from the incident context.

ID	Test Scenario	Test Action	Expected Result
TC-11	Change Linkage	User creates or associates a change request for an incident requiring change activity.	Change information is linked and visible from the incident.
TC-12	Review Priority Analytics	Administrator opens Platform Analytics and reviews incidents by priority.	Dashboard visualization displays the configured incident priority data.
TC-13	Review State Analytics	Administrator filters the dashboard by incident state.	Dashboard updates to reflect the selected state.
TC-14	Review Category Analytics	Administrator filters the dashboard by incident category.	Dashboard updates to reflect the selected category.
TC-15	Review Assignment Analytics	Administrator reviews/filter incidents by assignment group.	Dashboard reflects assignment-group based incident information.
TC-16	Review Dashboard	Administrator opens the completed incident monitoring dashboard.	Incident visualizations and configured filters are displayed correctly.

5. Open Issues / UAT Observations

No blocking issue was identified in the core incident lifecycle design. The main UAT observation is that the configured Client Script, assignment groups, state controls, and Platform Analytics dashboard must be correctly associated with the incident implementation. If the automation or configuration is not active, the intended priority, routing, lifecycle, or reporting behavior will not occur.

For UAT, priority combinations, assignment, resolution, closure, and reopening paths should be tested separately. Different Impact and Urgency combinations should be used to verify automatic priority calculation. The incident record and Platform Analytics dashboard can be used to verify lifecycle processing and reporting.

6. UAT Completion Summary

The acceptance testing scope covers Incident creation, classification, automatic priority calculation, assignment group routing, state management, resolution, closure, reopening, knowledge linkage, change linkage, and Platform Analytics monitoring. The intended result is a consistent automated incident process in which incidents are correctly prioritized, assigned, resolved, closed, and reported through the configured ServiceNow workflow.

UAT Evidence: The incident lifecycle configuration was reviewed using ServiceNow incident records where impact and urgency were used for priority calculation, assignment groups were used for ownership, and incident state and resolution information were used for lifecycle completion. Platform Analytics dashboard filters and visualizations were also configured for monitoring incidents by priority, state, category, and assignment group.
