

Project Design Phase Technology Stack (Architecture & Stack)

Date	17 September 2026
Team ID	Individual
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	4 Marks

The architecture and technology choices below are based on the ServiceNow Incident Lifecycle Automation project and the categories required by the uploaded template.

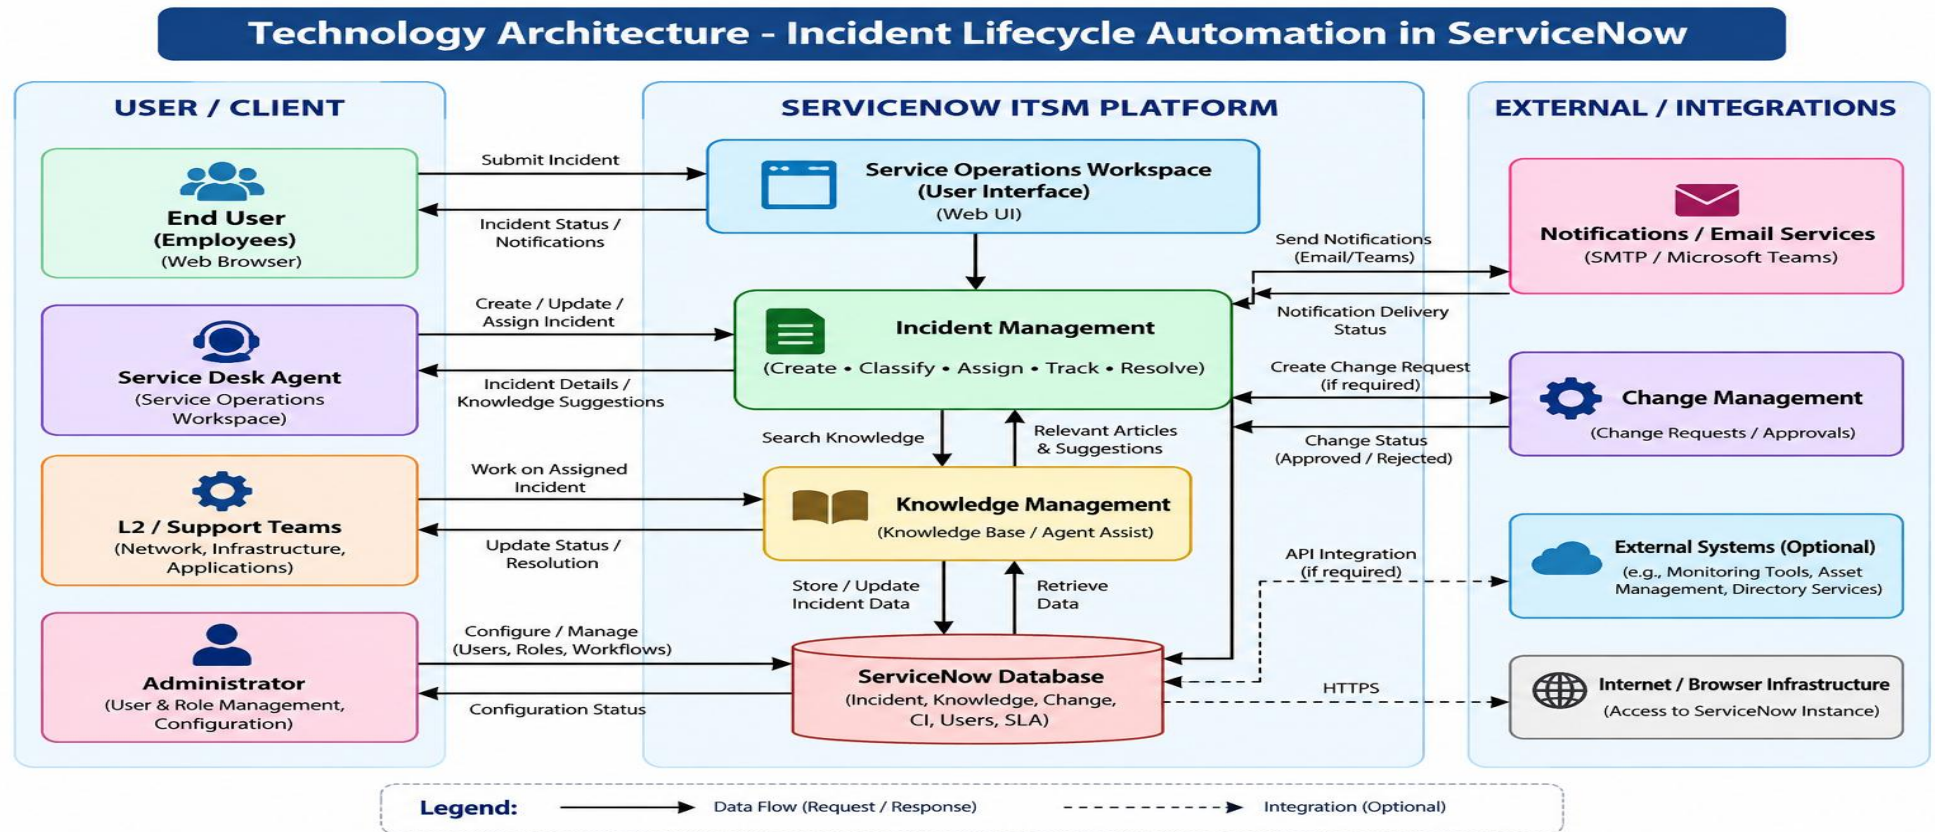

Table-1: Components & Technologies

S.No	Component	Description	Technology
1	User Interface	Interface used by end users and support staff to create, view, update, and resolve incidents.	Service Operations Workspace / ServiceNow Web UI
2	Application Logic-1	Incident lifecycle processing including creation, classification, assignment, escalation, and resolution.	ServiceNow Incident Management / ITSM
3	Application Logic-2	Knowledge-assisted troubleshooting and article attachment during incident handling.	ServiceNow Agent Assist / Knowledge Management
4	Application Logic-3	Change and related-record workflow when a change is required to resolve an incident.	ServiceNow Change Management / Related Records
5	Database	Stores incident records, users, services, configuration items, work notes, and related records.	ServiceNow platform database / CMDB
6	Cloud Database	Platform-managed data storage for the ServiceNow instance.	ServiceNow cloud platform data services
7	File Storage	Project evidence such as screenshots/documentation may be maintained separately; core incident data remains in ServiceNow.	Local filesystem / project documentation storage
8	External API-1	No external third-party API is required for the demonstrated prototype workflow.	Not used
9	External API-2	No second external API is required for the demonstrated prototype workflow.	Not used
10	Machine Learning Model	Not applicable to this ServiceNow ITSM project; automation is based on ServiceNow workflow and ITSM modules.	Not used
11	Infrastructure (Server / Cloud)	Hosts the ITSM application and provides browser-based access.	ServiceNow cloud instance; user access through modern web browser and Internet

Table-2: Application Characteristics

S.No	Characteristics	Description	Technology
1	Open-Source Frameworks	No open-source application framework is required for the demonstrated ServiceNow configuration. The solution uses native ServiceNow ITSM capabilities.	ServiceNow native platform
2	Security Implementations	Role-based access is used for authorized ServiceNow users such as admin/itil. Access to incident and related modules is controlled by platform roles and permissions.	ServiceNow roles / ACLs / ITIL access controls
3	Scalable Architecture	The solution uses ServiceNow's platform architecture and modular ITSM applications, allowing additional incidents, users, support groups, Knowledge articles, and related records to be handled within the platform.	ServiceNow ITSM platform
4	Availability	The application is accessed through the ServiceNow cloud instance using a web browser and Internet connection.	ServiceNow cloud platform
5	Performance	The workflow keeps incident, Knowledge, Change, SLA, and related-record operations within the ServiceNow platform to support efficient navigation and processing.	ServiceNow Workspace / platform services

Important scope note:

The uploaded template asks for external APIs and machine-learning interfaces. These are marked Not used because your documented ServiceNow project is an ITSM workflow automation solution and does not specify third-party APIs or machine-learning models.
