### Proposed Solution

| S.No. | Parameter                                | Proposed Solution                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | Problem Statement (Problem to be solved) | IT incidents may be difficult to create, classify, assign, track, escalate, and resolve consistently. Limited integration between incident handling, Knowledge, Change Management, SLA tracking, and related records can delay resolution and reduce visibility.                                                                                                                                                  |
| 2     | Idea / Solution description              | Develop an Incident Lifecycle Automation solution in ServiceNow that manages the incident from creation to resolution. The workflow includes incident classification, assignment and escalation, Agent Assist / Knowledge integration, Level 2 investigation, SLA tracking, change handling, child incident creation, cause and resolution documentation, and Knowledge article creation from resolved incidents. |
| 3     | Novelty / Uniqueness                     | The solution demonstrates an integrated incident lifecycle in one ServiceNow ITSM workflow, connecting Incident, Knowledge, Change, SLA, Service / Service Offering, Configuration Item, and related-record management. It also demonstrates reuse of resolved incidents as Knowledge content.                                                                                                                    |
| 4     | Social Impact / Customer Satisfaction    | Provides a structured way to handle IT issues, improves visibility of incident status and ownership, supports faster access to troubleshooting knowledge, and helps support teams document solutions for reuse. This can improve communication and the user experience during incident resolution.                                                                                                                |

|   |                                |                                                                                                                                                                                                                                                                                                                                                     |
|---|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | Business Model (Revenue Model) | The project is an ITSM automation solution demonstrated on the ServiceNow platform. A practical business model is enterprise ServiceNow implementation and customization, including workflow configuration, ITSM process automation, and ongoing platform support. Revenue can be generated through implementation and managed-service engagements. |
| 6 | Scalability of the Solution    | The workflow can be extended to additional services, support groups, incident categories, Knowledge articles, SLAs, Change processes, and users within the ServiceNow platform. The same lifecycle structure can be adapted for other IT services and organizational support teams.                                                                 |

**Proposed Solution Summary:**

A structured ServiceNow Incident Lifecycle Automation workflow that connects incident handling with Knowledge Management, Change Management, SLA tracking, and related records from incident creation through resolution.
