

Project Design Phase Solution Architecture

Date	18 September 2026
Team ID	Individual
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	4 Marks

Solution Architecture :

The following architecture is tailored to the ServiceNow Incident Lifecycle Automation project. It shows the main users, ServiceNow ITSM modules, data/process flow, and related services.

Solution Architecture - Incident Lifecycle Automation in ServiceNow

Solid arrows = core data/process flow Dashed arrows = response/status flow

Architecture Flow:

End User reports an issue → Service Desk creates and classifies the incident → ServiceNow Incident Management routes and tracks the incident → Agent Assist / Knowledge supports troubleshooting → Level 2 investigates → Change Management is used when a change is required → SLA and related records are tracked → the incident is resolved and the resolution can be reused as Knowledge.

Architecture Components:

Component	Role in Solution
User Interface	Service Operations Workspace / ServiceNow web interface.
Incident Management	Incident creation, classification, assignment, escalation, tracking, and resolution.
Knowledge Management	Agent Assist and Knowledge Base for troubleshooting and article reuse.
Change Management	Related or emergency change handling when an incident requires a change.

Workflow / SLA	Assignment, escalation, state transitions, and SLA tracking.
ServiceNow Data	Incident, service, service offering, CI, user, Knowledge, Change, and SLA-related records.
Notifications	Platform notifications and incident status communication.
Access & Administration	Role-based access and administration through appropriate ServiceNow roles.
