

Project Design Phase Problem – Solution Fit

Date	18 September 2026
Team ID	Individual
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	2 Marks

The following canvas is filled for the ServiceNow Incident Lifecycle Automation project, using the sections.

Problem – Solution Fit Canvas Incident Lifecycle Automation in ServiceNow			Team ID: Individual
Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS - Employees (End Users) – raise IT incidents (e.g., remote access, VPN, software issues, hardware issues) - Service Desk Agents – handle, classify and resolve incidents - Network / Level 2 Teams – work on assigned incidents - IT Managers / Administrators – monitor SLA, configure workflows and ensure service continuity	6. CUSTOMER CONSTRAINTS CC - Limited IT knowledge among end users - High volume of incidents and manual handling - Delays in classification and assignment - Lack of real-time visibility on incident status - Difficulty in tracking SLA compliance - Dependency on emails and calls for updates - Limited access to relevant knowledge articles - Complex change process for major incident fixes	5. AVAILABLE SOLUTIONS AS - Manual incident logging (email/phone) - Traditional ticketing systems (non-integrated) - Spreadsheets for tracking incidents - Legacy ITSM tools with limited automation - Self-help portals without AI/knowledge integration - Communication via emails and calls Pros: Basic incident tracking and communication. Cons: Manual, time-consuming, error-prone, no end-to-end automation.
	2. JOBS-TO-BE-DONE / PROBLEMS J&P - As an employee, I want to quickly raise an incident and get it resolved. - As a service desk agent, I want to classify and assign incidents accurately. - As a support team member, I want to receive the right incidents and resolve them efficiently. - As a manager, I want to track SLA and get real-time reports. - As an administrator, I want to configure workflows, users and knowledge base easily.	9. PROBLEM ROOT CAUSE RC - Lack of automation in incident lifecycle - Manual classification and assignment - Insufficient and hard-to-find knowledge articles - Lack of integration between incident, knowledge and change management - No real-time SLA monitoring and alerts - Communication gaps between teams and users - Repetitive incidents due to no self-service options - Inefficient tracking of related records (changes, child incidents)	
Identify strong TR & EM	3. TRIGGERS TR - When an employee faces an IT issue (e.g., cannot access VPN, system down) - When a service request or software access is needed - When SLA deadlines are approaching or breached - When there is a major incident affecting multiple users - When users receive system alerts or error messages	10. YOUR SOLUTION SL Incident Lifecycle Automation in ServiceNow - End-to-end incident lifecycle from creation to closure - Automated classification and assignment - AI-powered Agent Assist with knowledge integration - SLA tracking with real-time alerts and dashboards - Change management integration - Support for child incidents and related records - Self-service portal for users - Role-based access and workflows - Centralized knowledge base for faster resolution - Improved communication and notifications	8. CHANNELS OF BEHAVIOUR CH 8.1 ONLINE - ServiceNow Self-Service Portal - Company intranet / IT portal - Email notifications - Microsoft Teams / Chat integration - Knowledge base and service catalog 8.2 OFFLINE - IT service desk (walk-in / phone) - Internal training and awareness sessions - User guides and documentation - IT communication through meetings and emails
	4. EMOTIONS: BEFORE / AFTER EM Before: Frustration, confusion, anxiety, dependency on others, lack of visibility, dissatisfaction. After: Confidence, ease of use, faster resolution, transparency, higher satisfaction, trust in IT services.		

Problem–Solution Fit Statement:

The proposed ServiceNow workflow addresses the identified incident-management problems by bringing incident creation, classification, Knowledge assistance, assignment, escalation, change handling, SLA tracking, resolution, and knowledge reuse into a structured lifecycle.
